

944 SPEC BUILD

Posted by Nosferatu - 26 Feb 2013 18:52

I have been planing to start to post the build for quite some time. Hopefully I will figure out how to post the photos here. This is the car a few days after I bought it. I paid \$1,200 for the car on eBay. I drove it back home but it was a 30 mile adventure. One of the wheels caliper was locked, the tires where bold and leaking air and I fought the suspension all the way back home. The engine was great despite the fact that there was an engine fire recently and some of the wires are melted. I will post more pictures as I progress with the build.

The cage looks good. My only concern is you diagonal across the main hoop. The bars should be almost touching.

NASA CCR- 15.6.14.B Tube / Mounting Plate Specifications

Any number of tubes may attach to a plate so long as they are touching each other at the plate. There may be

a small gap between tubes to allow welding 360 degrees around each tube. If there is no gap between the

tubes, they must be welded around the base as much as possible to form a single figure-eight weld, AND the

tubes must be welded to each other for two (2) inches up from the base plate.
