

exhaust ??

Posted by cullenwinter - 22 Mar 2008 13:00

Our local muffler guy (and corvette racer) is willing to hook me up with some work at greatly reduced cost, so I am planning to have him remove the cat. Here's my question:

How much weight will I lose by replacing the cat with a piece of straight pipe ? (I've got to be careful, not a whole lot more can come out of my car)

Thanks

I can verify that. Car runs fine with a straight pipe, even makes good torque on the dyno, but for the sake of my hearing, I'm looking at straight-through muffler of some type for this season.

I installed a Dynomax bullet series muffler with a turn-down right in front of the rear torsion bar housing. The muffler itself weighs 4 lbs, so the system is significantly lighter than the stock pipe & muffler, but it's pretty loud.

Dave, does your exhaust exit down under the car, or out the side?

Under the car.

The #67 has a "cherry bomb" in the middle and exits at the back and it's too loud for me. I'm going to add something to it.
